User stories:
On our meeting with our client on Monday February 8, we showed our clients what we did during the week, and here is what they want from us:
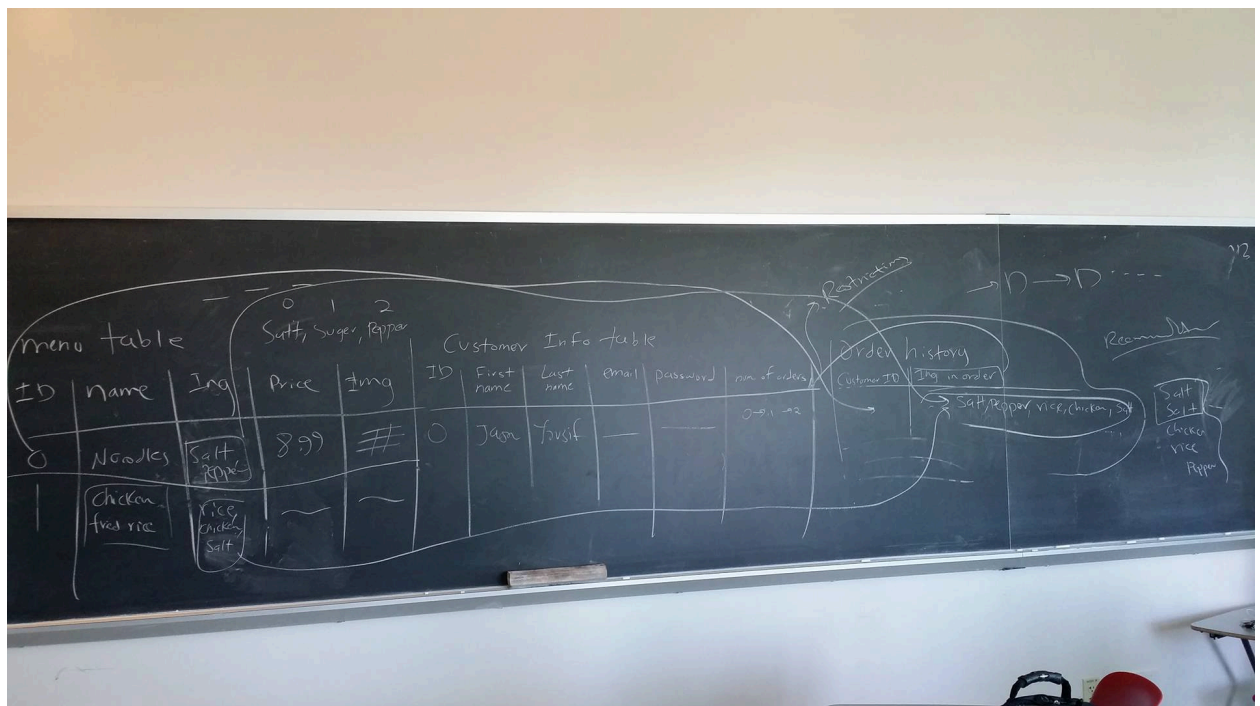

- As a customer, I want to be able to assign ingredients in the level up importance, so that I can see the the main ingredients like meat are more important than spice.
- As a customer, I want to be able to have two different modes, customer mode and restaurant mode, so hat I can get suggestions.
- As a customer, I want to be able to put the key word for my ingredient and save it, so that I can find and save the ingredient easier.
- As a customer, I want to be have the data global, instead of local, so that I can see if the app is what exactly I want it to be.

Schedule:
We have a solid idea what the data base look like.
We have a three main table:

- **Menu table**: ID, name, ingredient, price, Image
- **Customer Info**: ID, First Name, Last Name, email address, password, number of order, restriction (if you have allergy)
- **Order history**: customer ID, Ingredient in order

- 3 of us are working on the front end and 3 of us are working on the back end.

- We have 2 weekly regular group meeting one with the whole team and one with our sub teams.
